(hep-ph/0408356 + work in progress)

Outline

- Generalized pQCD approach with spin and \mathbf{k}_\perp -effects in distribution and fragmentation functions and elementary dynamics;
- SSA in $pp \Rightarrow \pi X$: theory - helicity formalism;
- SSA in $pp \Rightarrow \pi X$: phenomenology of the Collins effect;
- Conclusions and outlook

Unpolarized cross sections: k_\perp -factorization *ansatz*

- The collinear pQCD factorization formula for $AB \rightarrow CX$ reads

$$d\sigma^{AB \rightarrow CX} = \sum_{a,b,c,d} f_{a/A}(x_a) \otimes f_{b/B}(x_b) \otimes d\hat{\sigma}^{ab \rightarrow cd}(\hat{s}, \hat{t}) \otimes D_{C/c}(z)$$

$$\hat{s} = sx_a x_b, \quad \hat{t} = tx_a/z, \quad \hat{u} = ux_b/z$$

- Including transverse momenta we have:

$$\Rightarrow \sum_{a,b,c,d} \hat{f}_{a/A}(x_a, \mathbf{k}_{\perp a}) \otimes \hat{f}_{b/B}(x_b, \mathbf{k}_{\perp b}) \otimes d\hat{\sigma}^{ab \rightarrow cd}(\hat{s}, \hat{t}) \otimes \hat{D}_{C/c}(z, \mathbf{k}_{\perp C})$$

$$\hat{s} \rightarrow \hat{s} \phi_s(\mathbf{k}_{\perp a}, \mathbf{k}_{\perp b}), \quad \hat{t} \rightarrow \hat{t} \phi_t(\mathbf{k}_{\perp a}, \mathbf{k}_{\perp C}), \quad \hat{u} \rightarrow \hat{u} \phi_u(\mathbf{k}_{\perp b}, \mathbf{k}_{\perp C})$$

+ Jacobian in FF + Cahn effect + Gaussian k_\perp -depend.; + factoriz. ...

see U. D., F. Murgia: hep-ph/0408092, PRD in press

k_\perp - effects

1. k_\perp alters $\langle x \rangle$: small shift but important at large x where PDF are varying rapidly.
 → *enhanced higher-twist* effect (up to a factor of 10 in a cross section);
2. the partonic scattering angle in the pp c.m. frame might be much smaller than the hadronic production angle, thus enhancing the moderately large p_T inclusive production of particles;
3. spin and k_\perp -effects generated by soft mechanisms: SSA ($pp \rightarrow hX$)
 - (a) Sivers PDF: $S \cdot (\mathbf{P} \times \mathbf{k}_{\perp q})$
 - (b) Collins FF: $s_q \cdot (\mathbf{p}_q \times \mathbf{k}_{\perp h})$
 - (c) Boer-Mulders PDF: $s_q \cdot (\mathbf{P} \times \mathbf{k}_{\perp q})$
 - (d) polarizing FF: $S_h \cdot (\mathbf{p}_q \times \mathbf{k}_{\perp h})$

Polarized cross sections: Helicity formalism

- ◊ **Helicity density matrices**, in the \mathbf{k}_\perp -factorization scheme, to describe parton spin states for a **polarized cross section**:

$$d\sigma^{A,S_A+B,S_B \rightarrow C+X} = \sum_{a,b,c,d,\{\lambda\}} \rho_{\lambda_a, \lambda'_a}^{a/A, S_A} \hat{f}_{a/A, S_A}(x_a, \mathbf{k}_{\perp a}) \otimes \rho_{\lambda_b, \lambda'_b}^{b/B, S_B} \hat{f}_{b/B, S_B}(x_b, \mathbf{k}_{\perp b}) \\ \otimes \hat{M}_{\lambda_c, \lambda_d; \lambda_a, \lambda_b} \hat{M}_{\lambda'_c, \lambda_d; \lambda'_a, \lambda'_b}^* \otimes \hat{D}_{\lambda_c, \lambda'_c}^{\lambda_C, \lambda'_C}(z, \mathbf{k}_{\perp C})$$

- $\rho_{\lambda_a, \lambda'_a}^{a/A, S_A}$: helicity density matrix of parton a inside hadron A with polarization S_A
- $\frac{d\hat{\sigma}^{ab \rightarrow cd}}{d\hat{t}} \simeq \sum_{\lambda_a, \lambda_b, \lambda_c, \lambda_d} |\hat{M}_{\lambda_c, \lambda_d; \lambda_a, \lambda_b}|^2$ (scattering amplitudes)
- $\hat{D}_{\lambda_c, \lambda'_c}^{\lambda_C, \lambda'_C} \equiv \oint_{X, \lambda_X} \hat{\mathcal{D}}_{\lambda_C, \lambda_X; \lambda_c} \hat{\mathcal{D}}_{\lambda'_C, \lambda_X; \lambda'_c}^*$
i.e. the product of *fragmentation amplitudes* for the $c \rightarrow C + X$ process

Helicity density matrices: PDF sector

- Partonic distribution function at L.O. (and twist two) can be interpreted as the inclusive cross section for the process $A \rightarrow a + X$.

Helicity density matrix of parton $a \leftrightarrow$ to the helicity density matrix of hadron A .

$$\hat{f}_{a/A, S_A}(x_a, \mathbf{k}_{\perp a}) = \sum_{\lambda_A, \lambda'_A} \rho_{\lambda_a, \lambda'_a}^{a/A, S_A}$$

$$\hat{F}_{\lambda_A, \lambda'_A}^{\lambda_a, \lambda'_a} \equiv \oint_{X_A, \lambda_X} \hat{\mathcal{F}}_{\lambda_a, \lambda_X; \lambda_A} \hat{\mathcal{F}}_{\lambda'_a, \lambda_X; \lambda'_A}^*$$

Each helicity density matrix describes the spin orientation of a particle in its own helicity frame.

For a spin-1/2 particle, $\text{Tr}(\sigma_i \rho) = P_i$ is the i -component of the spin-polarization vector \mathbf{P} in the helicity rest frame of the particle.

The distribution function of parton a inside the polarized (S_A) hadron A is given by

$$\hat{f}_{a/A, S_A}(x_a, \mathbf{k}_{\perp a}) = \sum_{\lambda_a, \lambda_A, \lambda'_A} \rho_{\lambda_A, \lambda'_A}^{A, S_A} \hat{F}_{\lambda_A, \lambda'_A}^{\lambda_a, \lambda'_a}$$

- We have 16 $\hat{F}_{\lambda_A, \lambda'_A}^{\lambda_a, \lambda'_a}$ which by Parity constraints reduce to 6 independent products.
 4 of them are *Real functions*
 \Rightarrow 8 independent spin- \mathbf{k}_{\perp} PDF.

For instance:

$$\rho_{\pm, \pm}^{a/A, S_A} \hat{f}_{a/A, S_A}(x_a, \mathbf{k}_{\perp a}) \equiv \hat{f}_{a\pm/A, S_A}(x_a, \mathbf{k}_{\perp a})$$

Partonic interpretation: a few examples

Spin and k_\perp -dependent distribution and fragmentation functions of leading twist:
 [vs. notation of P.J. Mulders, R.D. Tangerman *Nucl. Phys.* **B461** (1996)]

- $\hat{f}_{q/p} = \hat{F}_{+,+}^{+,+} + \hat{F}_{-,-}^{-,-}$: unpolarized PDF
- $\Delta \hat{f}_{q/p} = \hat{F}_{+,+}^{+,+} - \hat{F}_{-,-}^{-,-}$: long. polariz. PDF
- $\hat{D}_{\pi/q} = \hat{D}_{++}^\pi$: unpolarized FF
- $\hat{f}_{q/p^\uparrow} - \hat{f}_{q/p^\downarrow} \equiv \Delta^N f_{q/p^\uparrow} = 4\text{Im}\hat{F}_{+,-}^{+,+} \propto (k_\perp/M)f_{1T}^\perp$: Sivers funct.
- $\hat{f}_{q^\uparrow/p} - \hat{f}_{q^\downarrow/p} \equiv \Delta^N f_{q^\uparrow/p} = 2\text{Im}\hat{F}_{+,-}^{+,-} \propto (k_\perp/M)h_1^\perp$: Boer-Mulders funct.
- $\hat{D}_{h/q^\uparrow} - \hat{D}_{h/q^\downarrow} \equiv \Delta^N D_{h/q^\uparrow} = 2\text{Im}D_{+-}^h \propto (k_\perp/M)H_1^\perp$: Collins funct.
- $\hat{f}_{q_+/p^\uparrow} - \hat{f}_{q_-/p^\uparrow} = 2\text{Re}\hat{F}_{+,-}^{+,+} \propto (k_\perp/M)g_{1T}$
- $\hat{f}_{q^\downarrow/p_+} - \hat{f}_{q^\uparrow/p_+} = 2\text{Re}\hat{F}_{+,-}^{+,-} \propto (k_\perp/M)h_{1L}^\perp$
- $\hat{f}_{q^\uparrow/p^\uparrow} - \hat{f}_{q^\downarrow/p^\uparrow} \Rightarrow \hat{F}_{+,-}^{+,-}; \hat{F}_{+,-}^{+,-} \propto h_1; (k_\perp/M)^2 h_{1T}^\perp$
- and gluons...

The master formula

$$d\sigma^{A,S_A+B,S_B \rightarrow C+X} = \sum_{a,b,c,d,\{\lambda\}} \rho_{\lambda_A, \lambda'_A}^{A,S_A} \hat{F}_{\lambda_A, \lambda'_A}^{\lambda_a, \lambda'_a}(\mathbf{k}_{\perp a}) \otimes \rho_{\lambda_B, \lambda'_B}^{B,S_B} \hat{F}_{\lambda_B, \lambda'_B}^{\lambda_b, \lambda'_b}(\mathbf{k}_{\perp b}) \\ \otimes \hat{M}_{\lambda_c, \lambda_d; \lambda_a, \lambda_b} \hat{M}_{\lambda'_c, \lambda'_d; \lambda'_a, \lambda'_b}^* \otimes \hat{D}_{\lambda_c, \lambda'_c}^{\lambda_C, \lambda'_C}$$

On summing over $\{\lambda'\text{'s}\}$ we get all combinations of spin and \mathbf{k}_{\perp} - mechanisms in Single and Double Spin Asymmetries for unpolarized particle production.

Notice: even for $S_A = S_B = 0 \rightarrow \rho_{\lambda_A, \lambda'_A}^{A,S_A} = (1/2)\delta_{\lambda_A, \lambda'_A}$ (same for B) the unpolarized cross section would develop Boer-Mulders \otimes Collins effects ($h_1^\perp \otimes H_1^\perp$): negligible (checked numerically!).

[M. Anselmino, M. Boglione, U.D., E. Leader, S. Melis, F. Murgia, in preparation]

Single Spin Asymmetries: $A^\uparrow B \rightarrow \pi X, A_N = (d\sigma^\uparrow - d\sigma^\downarrow)/(d\sigma^\uparrow + d\sigma^\downarrow)$

- Configuration ($AB \equiv pp$):

AB center of mass frame - A along $+Z$ -axis, π in the XZ plane with \mathbf{p}_T parallel to $+X$ -axis. $S_A = \uparrow$ or \downarrow along Y -axis, $S_B = 0$.

Quantities to be considered (convoluted):

- Numerator of A_N

$$\begin{aligned} \Sigma(\uparrow, 0) - \Sigma(\downarrow, 0) &= \sum_{\{\lambda\}} \frac{(-i)}{2} \left[\hat{F}_{+,-}^{\lambda_a, \lambda'_a}(k_{\perp a}) - \hat{F}_{-,+}^{\lambda_a, \lambda'_a}(k_{\perp a}) \right] \\ &\quad \times \hat{F}_{\lambda_B, \lambda'_B}^{\lambda_b, \lambda'_b} \hat{M}_{\lambda_c, \lambda_d; \lambda_a, \lambda_b} \hat{M}_{\lambda'_c, \lambda'_d; \lambda'_a, \lambda'_b}^* \hat{D}_{\lambda_c, \lambda'_c}^\pi \end{aligned}$$

- Denominator of A_N (twice the unpolarized cross section)

$$\begin{aligned} \Sigma(\uparrow, 0) + \Sigma(\downarrow, 0) &= \sum_{\{\lambda\}} \frac{1}{2} \left[\hat{F}_{+,+}^{\lambda_a, \lambda'_a}(k_{\perp a}) + \hat{F}_{-,-}^{\lambda_a, \lambda'_a}(k_{\perp a}) \right] \\ &\quad \times \hat{F}_{\lambda_B, \lambda'_B}^{\lambda_b, \lambda'_b} \hat{M}_{\lambda_c, \lambda_d; \lambda_a, \lambda_b} \hat{M}_{\lambda'_c, \lambda'_d; \lambda'_a, \lambda'_b}^* \hat{D}_{\lambda_c, \lambda'_c}^\pi \end{aligned}$$

Helicity scattering amplitudes with full \mathbf{k}_\perp

- \mathbf{k}_\perp 's imply: non-planar $ab \rightarrow cd$ scattering; different \perp directions.

Parton helicity amplitudes in pp c.o.m frame in terms of hel. amplitudes in partonic c.o.m. frame.

- 1) Boost along $\mathbf{p}_a + \mathbf{p}_b$: $S \rightarrow S'$
- 2) Rotation to put \mathbf{p}'_a along Z axis: $S' \rightarrow S''$

- $\hat{M}_{\lambda_c, \lambda_d; \lambda_a, \lambda_b} = \hat{M}_{\lambda_c, \lambda_d; \lambda_a, \lambda_b}^0(\hat{s}, \hat{t}) e^{i \sum_m \lambda_m \xi_m} e^{i(\lambda_a - \lambda_b) \phi_c''}$

Notice: various combinations of “T-odd” effects in (un)polarized cross sections but by including proper phases + numerical (VEGAS) integration:

$$\begin{aligned} d\sigma^{\text{unp}} &\simeq f_{a/p} \otimes f_{b/p} \otimes d\hat{\sigma} \otimes D_{\pi/c} \\ d\sigma^\uparrow - d\sigma^\downarrow &\simeq \Delta^N f_{a/p\uparrow} \otimes f_{b/p} \otimes d\hat{\sigma} \otimes D_{\pi/c} \quad \text{“Sivers effect”} \\ &\quad + h_{1a} \otimes f_{b/p} \otimes d\Delta\hat{\sigma} \otimes \Delta^N D_{\pi/c\uparrow} \quad \text{“Collins effect”} \end{aligned}$$

⇒ Let's focus on Collins effect

On summing over $\{\lambda\}$ [$\lambda_a \neq \lambda'_a$ and $\lambda_b = \lambda'_b$] we get ($b = q, \bar{q}, g$)

$$\begin{aligned}
 [\Sigma(\uparrow, 0) - \Sigma(\downarrow, 0)]_{qb} &= \left\{ \begin{array}{l} F_{+-}^{+-}(x_a, k_{\perp a}) \cos[\phi_a + \phi_c'' - \xi_a - \tilde{\xi}_a + \xi_c + \tilde{\xi}_c + \phi_\pi^H] \\ - F_{-+}^{+-}(x_a, k_{\perp a}) \cos[\phi_a - \phi_c'' + \xi_a + \tilde{\xi}_a - \xi_c - \tilde{\xi}_c - \phi_\pi^H] \end{array} \right\} \\
 &\times \hat{f}_{b/B}(x_b, k_{\perp b}) \left[\hat{M}_1^0 \hat{M}_2^0(x_a, x_b, z; \mathbf{k}_{\perp a}, \mathbf{k}_{\perp b}, \mathbf{k}_{\perp \pi}) \right]_{qb} \\
 &\times [2 \operatorname{Im} D_{+-}^\pi(z, k_{\perp \pi})]
 \end{aligned}$$

$$(\hat{M}_1^0)_{qb} \equiv \hat{M}_{+,+;+,+}^0 = \hat{M}_{-,-;-,-}^0 \quad (\hat{M}_2^0)_{qb} \equiv \hat{M}_{-,+;-,+}^0 = \hat{M}_{+,-;+,-}^0$$

The product $\hat{M}_1^0 \hat{M}_2^0$, is, for a collinear collision with scattering plane $\equiv XZ$, related to the spin transfer cross section:

$$\frac{1}{16\pi\hat{s}^2} \left[\hat{M}_1^0 \hat{M}_2^0 \right]_{qb} = \frac{d\hat{\sigma}^{q^\uparrow b \rightarrow q^\uparrow b}}{d\hat{t}} - \frac{d\hat{\sigma}^{q^\uparrow b \rightarrow q^\downarrow b}}{d\hat{t}}$$

Maximization of the Collins mechanism in $p^\dagger p \rightarrow \pi X$

In the notations of P.J. Mulders, R.D. Tangerman *Nucl. Phys.* **B461** (1996):

$$\begin{aligned} F_{+-}^{+-}(x, k_\perp) &= h_1(x, k_\perp) = h_{1T}(x, k_\perp) + \frac{k_\perp^2}{2M_p^2} h_{1T}^\perp(x, k_\perp) \\ F_{-+}^{+-}(x, k_\perp) &= \frac{k_\perp^2}{2M_p^2} h_{1T}^\perp(x, k_\perp) \\ 2 \operatorname{Im} D_{+-}^\pi(z, k_\perp) &= \Delta^N D_{\pi/q^\dagger}(z, k_\perp) = \frac{2k_\perp}{zM_\pi} H_1^{\perp q}(z, k_\perp) \end{aligned}$$

The following positivity bounds hold [A. Bacchetta, *et al. Phys. Rev. Lett.* **85** (2000)]:

$$\begin{aligned} |h_1(x, k_\perp)| &\leq \frac{1}{2} [q(x, k_\perp) + \Delta q(x, k_\perp)] = q_+(x, k_\perp) \\ \frac{k_\perp^2}{2M_p^2} |h_{1T}^\perp(x, k_\perp)| &\leq \frac{1}{2} [q(x, k_\perp) - \Delta q(x, k_\perp)] = q_-(x, k_\perp) \\ |\Delta^N D_{\pi/q^\dagger}(z, k_\perp)| &\leq 2D_{\pi/q}(z, k_\perp) \end{aligned}$$

Let's consider $A_N(\pi^+)$: u, d active flavor for h_1 and h_{1T}^\perp :

$$h_1^u(x, k_\perp) = u_+(x, k_\perp) \quad h_1^d(x, k_\perp) = -d_+(x, k_\perp)$$

$$\frac{k_\perp^2}{2M_p^2} h_{1T}^{\perp u}(x, k_\perp) = -u_-(x, k_\perp) \quad \frac{k_\perp^2}{2M_p^2} h_{1T}^{\perp d}(x, k_\perp) = +d_-(x, k_\perp)$$

being the product of elementary amplitudes $\hat{M}_1^0 \hat{M}_2^0 < 0$, to get $A_N(\pi^+) > 0$

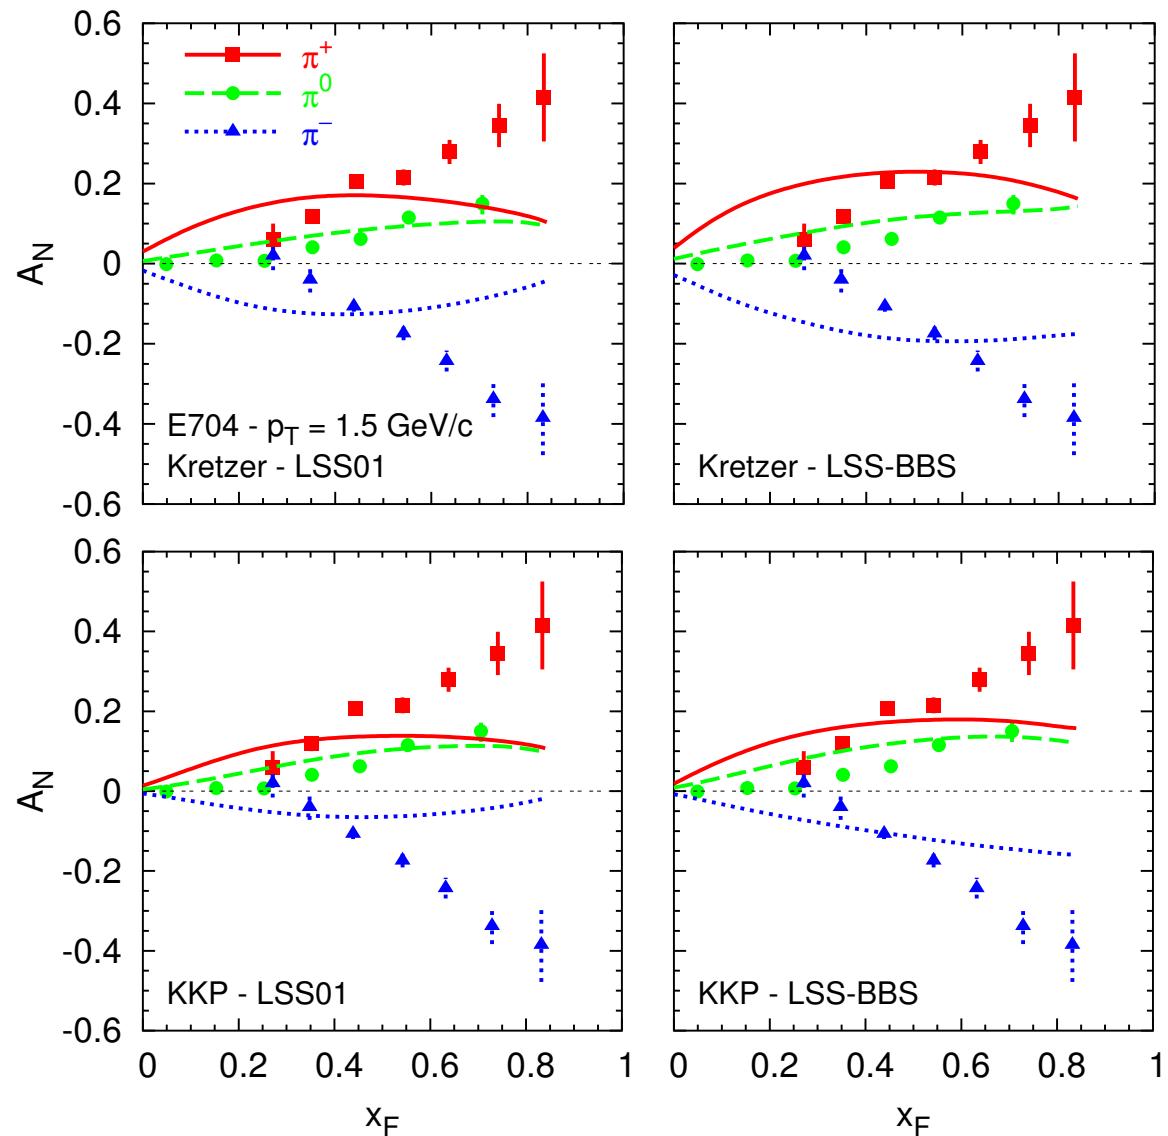

$$\Rightarrow \Delta^N D_{\pi^+ / u^\uparrow}(z, k_\perp) = -2D_{\pi^+ / u}(z, k_\perp)$$

Contribution (maximized) of the sub-leading channel *down* \rightarrow *down* (neglected in former studies); since $h_1^d < 0$, to add in sign, we use

$$\Delta^N D_{\pi^+ / d^\uparrow}(z, k_\perp) = +2D_{\pi^+ / d}(z, k_\perp)$$

A_N for π^- 's is maximized in size (by isospin invariance).

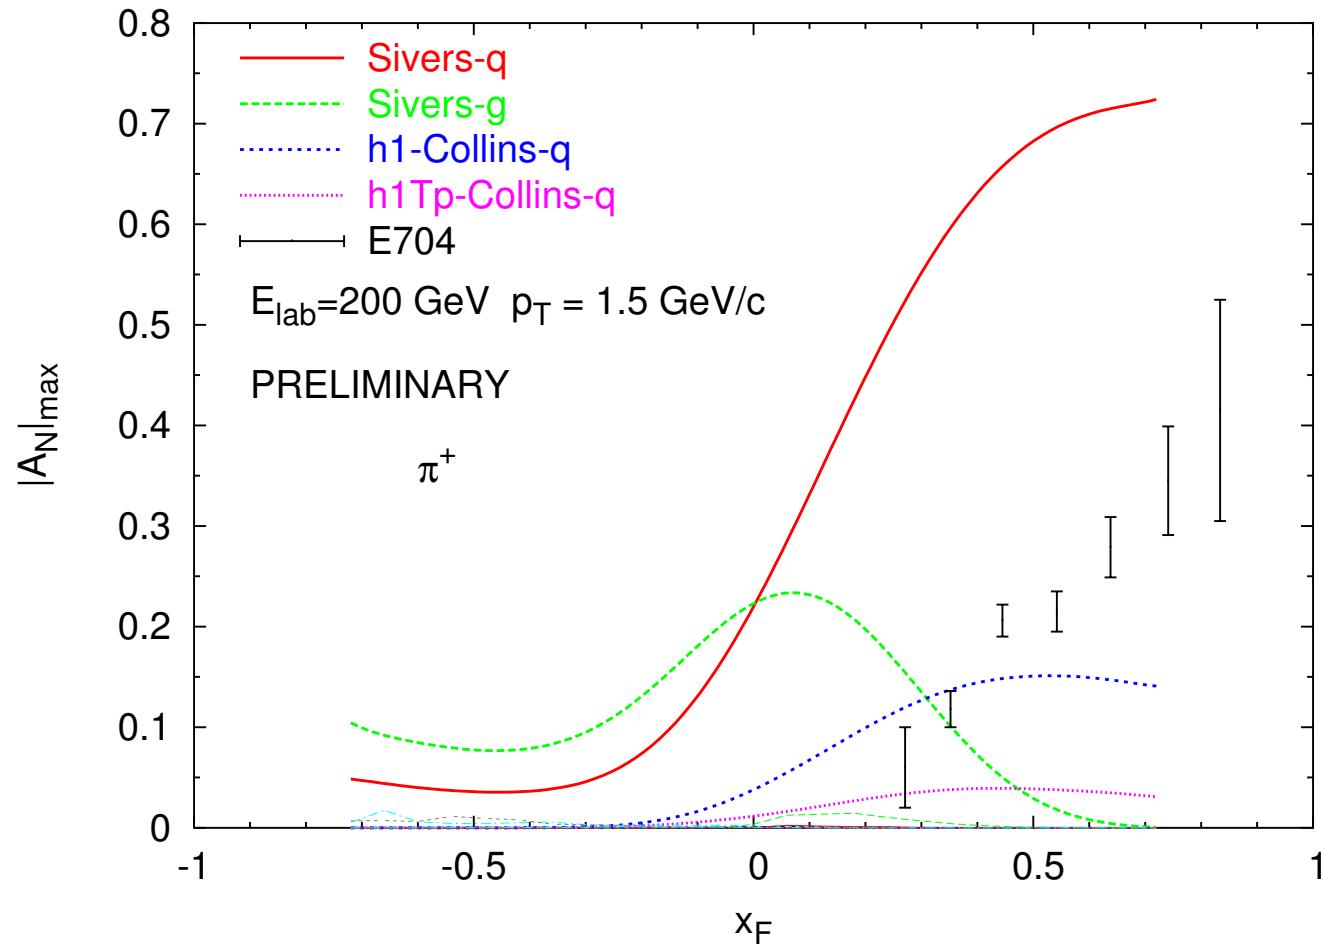

- Pol PDF: LSS01 and LSS-BBS ($\Delta d > 0$ at large $x \rightarrow$ more relaxed bound on h_1^d)
- FF: Kretzer (sea $\simeq (1 - z)$ valence) and KKP (sea suppressed)

Maximized estimates
of $A_N(\pi)$ for
 $p^\uparrow p \rightarrow \pi X$ vs. x_F ,
at $\langle p_T \rangle = 1.5 \text{ GeV}/c$
and $\sqrt{s} = 20 \text{ GeV}$.

**Collins mechanism
full saturated.**

Data are from [E704]
D.L. Adams *et al.*,
Phys. Lett. B261 (1991)
and A. Bravar *et al.*,
Phys. Rev. Lett. 77 (1996).

(Over)Maximized estimates of A_N : all possible contributions.

Conclusions and outlook

- A generalized pQCD approach to SSA and unpol. cross sections:
LO-pQCD + spin and new \mathbf{k}_\perp -dependent PDF and FF;
- $A_N(p^\uparrow p \rightarrow \pi X)$: Complete \mathbf{k}_\perp -helicity formalism and phenomenology.
True detailed microscopic dynamics (proper phases) \Rightarrow Sivers effect results confirmed; Collins effect suppressed (against former claims!);
- $p^\uparrow p \rightarrow \pi$ jet X : to extract Collins effect (less severe phases cancellations);
- $AB \rightarrow CX$ ($C = \pi, \Lambda, \rho$): Complete \mathbf{k}_\perp -helicity formalism and phenomenology for $A_{LL}, A_{TT}, A_{LT}, P$ (in progress). *Role of “T-odd” effects in $A_{LL}(\pi)$* ;
- Azimuthal spin asymmetries in SIDIS: role of Collins & Sivers effect (+ Kotzinian & Prokudin: detailed \mathbf{k}_\perp approach in progress);
- $p^\uparrow p$ -data at large energies and at larger p_T , and ep^\uparrow -data with transversely polarized target *are very welcome*.
